## A first for internal de-burring: Carbide tools

Hartner's carbide tools for entry and exit de-burring operations are setting the benchmark for automatic de-burring. This, however, does not involve machining in the fullest sense of the word - as with, for example, conventional drills, milling cutters, taps, reamers and countersinks. Instead, the de-burring tool very carefully shaves off the burr and can also, if required, create a chamfer.

For the quality of a workpiece – especially with intersecting and cross holes – then de-bur-ring of the back of hole is gaining more and more importance. This applies to, for example, oil galleries in modern high performance engines, where an optimal flow rate is dependent on perfect de-burring of the back of the hole. Highly accurate de-burring and producing a chamfer is also increasingly required in crankshafts, valve blocks, steering arms, rotational housings, drive elements, injector nozzles and brake cylinders.

Whilst the de-burring of the entry to the hole hardly causes a problem, the de-burring of through holes in many cases involves an extensive operation that is often carried out manually and is time and cost intensive.

With the newly developed and patented carbide tools for exit de-burring, Hartner is providing the possibility to automate and rationalise this production step applying high performance tools.

There is a choice of three solutions:

1. De-burring fork TS 100 EG - standard tool
2. Front/back de-burrer TS 100 VR as standard tool
3. De-burring spiral TS 100 ES - semi-standard tool

This not only means a considerable cost and time saving for the production, but also, more importantly, improved quality and process reliability.

Solid carbide de-burring fork TS 100 EG

Exit of through hole prior to ...

...and following machining with de-burring fork.

## De-burring fork TS 100 EG

### Advantages:

- cost saving. The standard tool offers outstanding price advantages in comparison with special tooling.
- universal tooling for milling, turning and robotic applications. The range of 0.25 mm enables the application of our de-burring fork in holes with large tolerances. Reducing set-up time and cost!
- increased production. De-burring fork TS 100 EG de-burrs automatically with one set-up and short cycle times. Expensive and extensive manual operations are no longer required.

### Operation

### Application examples

#### 1. example

Workpiece with cross-hole

Please note when machining workpieces with cross-holes:

- the diameter of the cross-hole must be maximal 35% of the central hole
- the diameter of the cross-hole must be 40% larger than the cutting length  $l_6$

#### 2. example

Workpiece with multi-interrupted cut

### Step by step:

The automatically internal and external de-burring with de-burring fork TS 100 EG is an easy and cost saving alternative to common, extensive manual operations. Just one tool is required for all machining steps.

### Universal application:

The ex-stock de-burring fork machines workpieces with one cross-hole as well as workpieces with multi-interrupted cut and produces high quality de-burred faces and ends of the hole.

$\varnothing$ range (mm)	$v_c$ m/min	$f_u$ (mm)
< $\varnothing$ 4	8 - 10	0.1 - 0.2
$\varnothing$ 4 - < $\varnothing$ 6	10 - 14	0.1 - 0.2
6 - $\varnothing$ 8	14 - 20	0.1 - 0.2

### Important:

Please note, that the cutting parameters are recommendations. They can be adapted to higher and lower cutting parameters.

## Solid carbide de-burring spiral TS 100 ES - semistandard range

For exit de-burring through the central hole, Hartner has developed the solid carbide de-burring spiral TS 100 ES. The slotted tool is available as a semi-standard tool with immediate effect, i. e. inside the diameter ranges specified in the adjacent table tools can be supplied in one-hundredth increments with the respective shank and length dimensions as well as number of cutting edges with short delivery times and at favourable prices. In addition, at any time other customer specific solutions as special tools, for example, with further reach or other shank diameters.

The principle of function of the de-burring spiral TS 100 ES is based on the pre-tension of the grooved cutting portion. In the area of the cutting portion, the de-burring spiral has a fractionally larger diameter than the bore to be machined. Through the run-on, the grooved cutting portion is pressed together on entry into the hole to be machined and thereby pre-tensioned. The pre-tension ensures that inside the bore and especially in the area of the cross-hole to be de-burred there is a perfect fit of the cutting spiral at the wall of the bore or the edges of the cross-hole respectively. The burr in the cross-hole is subsequently accurately and cleanly peeled off

at the root. Thereby very small chips are created that can be evacuated problem-free from the hole.

Pre-requisite for the development of the de-burring spiral TS 100 ES was a carbide as tool material that possesses an accordingly low rigidity and permits the necessary deformation in the cutting edge area. Thanks to Hartner's carbide expertise in development and production, then a carbide with such special attributes is available.

### Cutting parameters de-burring spiral

Ø range (mm)	v <sub>c</sub> m/min	f <sub>u</sub> (mm)
< Ø 8	15 - 25	0.2 - 0.3
≥ Ø 8	15 - 25	0.4 - 0.8

### Important:

Please note, that the cutting parameters are recommendations. They can be adapted to higher and lower cutting parameters.

### Principle of function

### Entry:

Entry feed with max. helix of the tool up to the first cross-hole.

### De-burring:

Moving over the cross-hole with the specified operating feed. Thereby, at least 50% of the head length must pass the cross-hole.

### Chip is peeled off

### Exit:

Turning clockwise with approx. 2 - 5 x feed rate or turning anti-clockwise with helix

# HARTNER

## Front/back de-burrer TS 100 VR

Hartner's solid carbide TS 100 VR front/back de-burrer with TiAlN-coating as a standard tool enables de-burring as well as chamfering of hole entry and exit with a 90° angle.

TS 100 VR possesses a milling head with a front and back cutting region. To de-burr or chamfer the tool performs a circular milling movement along the hole edge or contour.
